

Cone Drive

**SERIES B**  
POWER TRANSMISSION SOLUTIONS

## PRODUCTS IN THE RANGE

Serving an entire spectrum of mechanical drive applications from food, energy, mining and metal; to automotive, aerospace and marine propulsion, we are here to make a positive difference to the supply of drive solutions.

**Model HP**

Worm gear units with double-enveloping worm gearing. Available in single, double and triple reductions

**Model HP-A**

Universal metric housing featuring double-enveloping gearing & drywell feature

**Series B**

Industrial duty worm gear unit featuring Conex gearing

**DuoDrive**

Dual gears on parallel output shafts

**Extruder Drive**

Rugged duty reducer takes high screw pressure

**Stainless**

Right angle, IP 69K rated for the food processing market

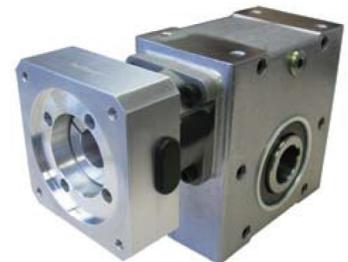

**Series W**

Precision right angle servo gearboxes

**Model RG**

Moderate precision right angle servo gearboxes

**Series S**

Value engineered right angle servo gearboxes

**Series P**

Precision planetary servo gearboxes

**Series E**

Economical planetary servo gearboxes

**Series LE**

In-line helical geared motors & reducers

**We can create custom engineered transmission solutions of any size and configuration.**

## INDUSTRIAL DUTY GEARMOTORS AND REDUCERS

The Series B right angle gearmotors and reducers provide a highly flexible and compact solution to meet the low to medium power range. With power capabilities up to 20 HP and maximum output torque capacity of 8,000 lb.in. We can provide design flexibility with lasting performance.

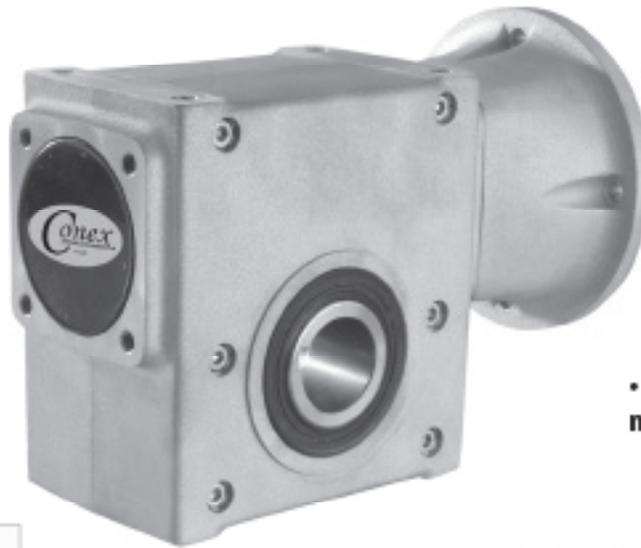

The Series B benefits from over 200 years of cumulative experience in the design and manufacture of high quality mechanical power transmission solutions. With features like our patented motor connection and the unique *Swift Kit* concept. Series B is the answer for your right angle drive requirements.

- **Conex™ inside, new helical gear geometry provides high capacity and high efficiency.**

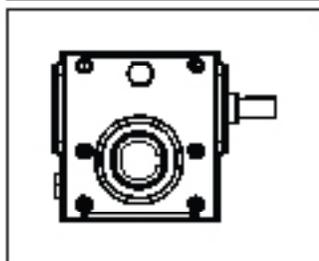

- **Manufactured and assembled from a family of modular kits for quick delivery.**

- **Patented motor connection eliminates fretting corrosion and provides easy motor removal.**

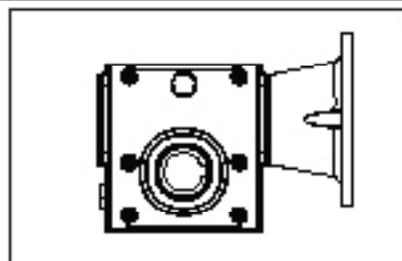

- **Hollow bore standard for maximum flexibility.**

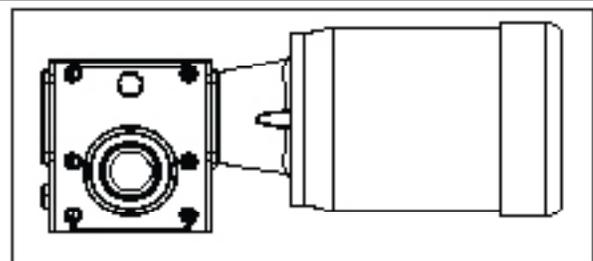

- **Dimensionally interchangeable with other major manufacturers.**

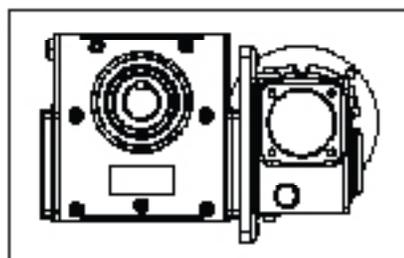

Standard single reduction reducer unit.

Motor ready unit

Motorized Reducer unit

Motorized Double Reduction Reducer unit

## Series B

Series B right angle gearmotors and reducers provide a very compact solution to meet the demands of today's industrial drive requirements. With over 200 years of cumulative experience in design and manufacturing has resulted in a range of right angle products offering high load carrying capacity, high efficiency, quiet running and reliability with lasting performance.

### Single and Double Reduction Units

Series B is offered in unit sizes 02, 03, 04, 05, 06, 08, 09, 10 and 11 based on a single universal gear case for each size, giving a high degree of common parts and interchangeability. Units can be mounted in all mounting positions and provide a choice of shaft arrangements for either motorized or reducer versions. Motors can be close coupled via a patented motor connection system offering power coverage from 0.25 HP to 10 HP.

All units are designed with hollow output shaft as standard, solid output shafts can be fitted allowing hand of assembly to be changed without dismantling the unit. Double extended output shafts are also available.

Series B offers a choice of 10 standard ratios from 5/1 to 60/1 in Single Reduction units and 15 standard ratios from 100/1 to 3600/1 in Double Reduction units. All units are lubricated for life to reduce maintenance to a minimum.

### Motorized Units with Patented Motor Connection

Units are designed to be close coupled with standard dimension NEMA frame motors. The Patented Motor Connection system eliminates fretting corrosion allowing the easy removal of motors from the gearbox to minimize down time and maintenance time.

### Lubricated For Life

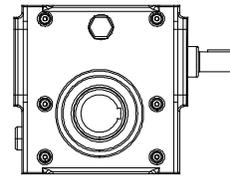

Series B units are factory filled with high quality synthetic lubricant which means:

- The product arrives ready for use
- No oil level checks, topping up, draining or re-filling
- No danger of starting up without lubricant
- Mount in any location, however inaccessible

### Sealed and Non-Vented

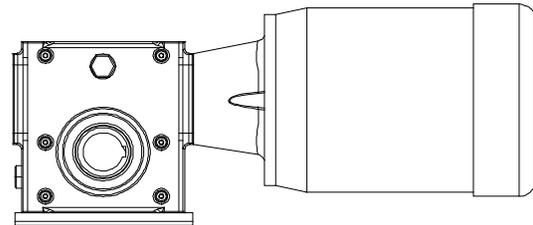

Series B units are sealed against the environment and operate without the need to be vented. This allows the product to be shipped factory filled yet doesn't require vents to be retrofitted in the correct position prior to operation. It also offers protection against the ingress of contaminants in the field and eliminates a leak path.

*As improvements in design are being made continually this specification is not to be regarded as binding in detail and drawings and capacities are subject to alteration without notice. Certified drawings will be sent on request.*

# Explanation & Use of Ratings & Service Factors

Gear unit selection is made by comparing actual loads with catalog ratings. Catalog ratings are based on a standard set of loading conditions, whereas actual load conditions vary according to type of application. Service Factors are therefore used to calculate an equivalent load to compare with catalog ratings. i.e. Equivalent Load = Actual Load x Service Factor

Two types of Service Factor must be considered: Mechanical Service Factor  $F_m$  and Thermal Service Factor  $F_t$

**Mechanical ratings and service factor  $F_m$**   
Mechanical ratings measure capacity in terms of life and/or strength, assuming 10 hr/day continuous running under uniform load conditions.

Catalog ratings allow for an 100% overload at starting, braking or momentarily during operation for a total of once per hour for each hour of operation.

The unit selected must therefore have a catalog rating at least equal to half maximum overload.

Mechanical Service Factor  $F_m$  (Table 1) is used to modify the actual load according to daily operating time, and type of loading.

Load characteristics for a wide range of applications are detailed in Table 3 opposite, which are used in deciding the appropriate Service Factor  $F_m$  from Table 1.

If overloads can be calculated, or accurately assessed, actual loads should be used instead of  $F_m$ .

For units subject to frequent stop/start overloads in excess of 10 times per day, contact our Application Engineers.

For applications where high inertia loads are involved e.g. crane travel drives, slewing motion etc., unit selection should be referred to our Application Engineers.

**Thermal ratings and service factors**  
The Thermal ratings are a measure of the gear units ability to dissipate heat. If they are exceeded the lubricant may overheat and breakdown, resulting in gear failure.

Catalog thermal limitations are based on the unit operating continuously in an environment with an ambient temperature equal to 68°F. The thermal rating is affected by ambient temperature. To account for these varying conditions, the service factors given in table 2 should be applied to the catalog thermal ratings as follows:

- $P_{therm} = (P_t \times F_t \times \text{efficiency}) / 100$
- $P_t$  = Catalog input power thermal rating (HP)
- $P_{therm}$  = Allowable output power thermal rating (HP)
- $F_t$  = Service factor for ambient temperature (see Table 2)

Prime mover	Duration of service hrs per day	Load classification-driven machine		
		Uniform	Moderate Shock	Heavy Shock
Electric motor, steam turbine or hydraulic motor	Under 3	0.80	1.00	1.50
	3 to 10	1.00	1.25	1.75
	Over 10	1.25	1.50	2.00
Multi-cylinder internal combustion engine	Under 3	1.00	1.25	1.75
	3 to 10	1.25	1.50	2.00
	Over 10	1.50	1.75	2.25
Single cylinder internal combustion engine	Under 3	1.25	1.50	2.00
	3 to 10	1.50	1.75	2.25
	Over 10	1.75	2.00	2.50

Ambient Temperature °F	-20	0	20	40	60	68	80	100	120
Factor $F_t$	1.64	1.50	1.36	1.22	1.07	1.00	0.92	0.77	0.63

**General**  
When selecting units, use actual load required to be transmitted, not rating of prime mover. Wherever possible use required output torque (lb-in). Catalog also gives input power rating (HP), being the power required from prime mover allowing for gear unit efficiency. When units transmit less than rated output torque, required input power may be reduced pro-rata to decide capacity of prime mover.

# Series B

# Load Classification by Application

Table 3

**U = Uniform load**  
**M = Moderate shock load**  
**H = Heavy shock load**  
**† = Contact our Application Engineers**

### EXAMPLE APPLICATION DETAILS

Absorbed power of driven machine = 0.50 HP  
 Output speed of gearbox or Input speed of machine = 58 RPM  
 Application = Uniformly loaded belt conveyor  
 Duration of service (hours per day) = 24hrs  
 Ambient temperature = 68°F

### 1 DETERMINE MECHANICAL SERVICE FACTOR (Fm)

Refer to Load Classification by Application, table 3, page 8  
 Application = Uniformly loaded belt conveyor

<b>Conveyors-uniformly loaded or fed</b>		U = Uniform load
apron	U	
assembly	U	
belt	U	
bucket	U	
chain	U	

Refer to mechanical service factor (Fm), table 1, page 7  
 Duration of service (hours per day) = 24hrs

Prime mover	Duration of service hrs per day	Load classification-drive	
		Uniform	Moderate Shock
Electric motor, steam turbine or hydraulic motor	Under 3	0.80	1.00
	3 to 10	1.00	1.25
	Over 10	1.25	1.50

### 2 DETERMINE REQUIRED OUTPUT TORQUE AT GEARBOX OUTPUTSHAFT

$$\text{Output Torque} = \frac{63025 \times \text{Input HP} \times \text{Ratio} \times \text{Reducer Efficiency}}{\text{Input speed}}$$

$$\text{Output Torque} = \frac{63025 \times 0.50 \times 30 \times 0.72}{1750}$$

$$\text{Output Torque} = 389 \text{ Lb. in}$$

See pages 65 - 68 for reducer efficiencies

### 3 SELECT GEARMOTOR

Refer to selection table one motor size larger than absorbed power.  
 Absorbed power = 0.50 HP, therefore refer to 0.50 HP selection table, page 33.

Required output speed of gearbox = 58 RPM

0.50 HP	OUTPUT SPEED	RATIO	OUTPUT TORQUE (LB-IN)	MECH S.F.	OHL (LB)	UNIT DESIGNATION	MOTOR FRAME	
							NEMA	IEC
4 Pole 1750 RPM	117	15	223	3.03	710	B 0 4 1 0 1 5 . _ M _ _ _ . 5 0 B _ _	56C	71
	88	20	281	2.40	710	2 0 .		
	70	25	337	2.16	710	2 5 .		
	58	30	387	1.81	710	3 0 .		
	44	40	462	1.36	710	4 0 .		
	35	50	526	1.16	710	5 0 .		
	29	60	574	0.99	710	6 0 .		

## 4 CHECK OUTPUT TORQUE

Output torque of selected unit must be equal or more than required output torque at gearbox outputshaft.  
 Required output torque at gearbox outputshaft = 389 lb.in

Selected unit's output torque = 700 lb.in, therefore unit is acceptable (See B0410 30:1 reducer rating on page 65)

## 5 CHECK SERVICE FACTOR

Service factor (Fm) of selected unit must be equal or more than required service factor.

Required service factor of gearbox = 1.25

0.50 HP	OUTPUT SPEED	RATIO	OUTPUT TORQUE (LB-IN)	MECH S.F.	OHL (LB)	UNIT DESIGNATION	MOTOR FRAME	
							NEMA	IEC
4 Pole 1750 RPM	117	15	223	3.03	710	B 0 4 1 0 1 5 . _ M _ _ _ _ . 5 0 B _ _	56C	71
	88	20	281	2.40	710	2 0 .		
	70	25	337	2.16	710	2 5 .		
	58	30	387	1.81	710	3 0 .		
	44	40	462	1.36	710	4 0 .		
	35	50	526	1.16	710	5 0 .		
	29	60	574	0.99	710	6 0 .		

Selected unit's service factor (Fm) = 1.81, therefore unit is acceptable.

## 6 CHECK OVERHUNG LOADS

If sprocket, gear, etc is mounted on the outputshaft then refer to Overhung Loads Procedure, page 64, and compare with allowable overhung load of selected unit

Allowable overhung load (LB) must be equal or more than calculated overhung load (P)

0.50 HP	OUTPUT SPEED	RATIO	OUTPUT TORQUE (LB-IN)	MECH S.F.	OHL (LB)	UNIT DESIGNATION	MOTOR FRAME	
							NEMA	IEC
4 Pole 1750 RPM	117	15	223	3.03	710	B 0 4 1 0 1 5 . _ M _ _ _ _ . 5 0 B _ _	56C	71
	88	20	281	2.40	710	2 0 .		
	70	25	337	2.16	710	2 5 .		
	58	30	387	1.81	710	3 0 .		
	44	40	462	1.36	710	4 0 .		
	35	50	526	1.16	710	5 0 .		
	29	60	574	0.99	710	6 0 .		

NOTE: If any of the following conditions occur then consult our Application Engineers:

- a) Inertia of the Driven Machine (Referred to motor speed) >10  
 Inertia of Gear Unit plus Motor
- b) Ambient temperature is above 120°F

### EXAMPLE APPLICATION DETAILS

Absorbed power of driven machine = 0.375 HP  
 Output speed of gearbox or Input speed of machine = 30 RPM  
 Application = Uniformly loaded belt conveyor  
 Duration of service (hours per day) = 24 hrs  
 Motor speed = 3 phase electric motor, 4 pole, 1750 RPM  
 Ambient temperature = 68°F

### 1 DETERMINE RATIO OF GEARBOX REQUIRED

$$\frac{\text{Motor speed}}{\text{Gearbox output speed}} = \frac{1750}{30} = 58.33$$

Refer to rating tables (pages 65 - 68) for nearest standard ratio = 60:1

### 3 DETERMINE REQUIRED MECHANICAL OUTPUT TORQUE CAPACITY OF GEARBOX

$$\text{Absorbed output torque} = \frac{\text{Absorbed power} \times 63025}{\text{Gearbox output speed}}$$

$$\frac{0.375 \times 63025}{30} = 788 \text{ lb.in}$$

$$\text{Required mechanical output torque} = \text{Absorbed output torque} \times F_m$$

$$788 \times 1.25 = 985 \text{ lb.in}$$

\*\*Note: Reducer efficiency not used. Generated torque will vary based on efficiency

### 2 DETERMINE MECHANICAL SERVICE FACTOR (Fm)

Refer to Load Classification by Application, table 3, page 7

Application = uniformly fed, belt conveyor

Conveyors-uniformly loaded or fed	
apron	U
assembly	U
belt	U
bucket	U
chain	U

U = Uniform loading

Refer to mechanical service factor (Fm), table 1, page 6

Duration of service (hours per day) = 24 hrs

Prime mover	Duration of service-hrs per day	Load classification-drive	
		Uniform	Moderate Shock
Electric motor, steam turbine or hydraulic motor	Under 3	0.80	1.00
	3 to 10	1.00	1.25
	Over 10	1.25	1.50

Therefore mechanical service factor (Fm) = 1.25

### 4 DETERMINE SIZE OF GEAR BOX REQUIRED

Refer to ratings tables, Input speed = 1750RPM, therefore refer to page 65.

RATIO	OUTPUT SPEED	CAPACITY	SIZE OF UNIT								
			B0210	B0310	B0410	B0510	B0610	B0810	B0910	B1010	B1110
60	29	Input Power HP (mech)	0.29	0.38	0.50	0.64	0.98	1.24	1.70	2.05	2.52
		Input Power HP (therm)	0.42	0.55	0.81	0.92	1.31	1.79	2.13	2.70	2.88
		Output Torque lb-in (mech)	272	404	570	782	1305	1699	2427	2986	3739
		Efficiency	0.43	0.49	0.53	0.57	0.61	0.64	0.66	0.67	0.69

Mechanical output torque capacity must be equal or more than required mechanical output torque capacity of gear box. Required mechanical output torque capacity = 985 lb-in. At a 60:1 ratio, nominal output speed 29 an B0610 unit has a mechanical output torque capacity of 1305 lb-in. Therefore the unit is acceptable.

### 5 DETERMINE REQUIRED OUTPUT TORQUE AND POWER

(Based on known reducer running efficiency)

Refer to ratings tables to determine gear unit efficiency

RATIO	OUTPUT SPEED	CAPACITY	SIZE OF UNIT								
			B0210	B0310	B0410	B0510	B0610	B0810	B0910	B1010	B1110
60	29	Input Power HP (mech)	0.29	0.38	0.50	0.64	0.98	1.24	1.70	2.05	2.52
		Input Power HP (therm)	0.42	0.55	0.81	0.92	1.31	1.79	2.13	2.70	2.88
		Output Torque lb-in (mech)	272	404	570	782	1305	1699	2427	2986	3739
		Efficiency	0.43	0.49	0.53	0.57	0.61	0.64	0.66	0.67	0.69

Running efficiency of B0610 60:1 at 1750 RPM = 61%

$$\text{Output Torque} = \frac{63025 \times \text{Input Power} \times \text{Ratio} \times \text{Efficiency}}{\text{Input RPM}}$$

$$\text{Output Torque} = \frac{63025 \times 0.375 \times 60 \times 0.61}{1750}$$

Output Torque = 494 Lb. in (This is the actual output torque produced with 0.375 Hp input power.)

If the application requires greater output torque then the input power must be increased, in which case the input power rating of the reducer must be checked.

$$\text{Required motor power} = \frac{\text{Input power}}{\text{Efficiency}} \times 100 = \frac{0.375}{61} \times 100 = 0.615 \text{ HP}$$

Next largest motor is 0.75 Hp (The B0610 60:1 is rated for 0.98 Hp and is acceptable)

## 6 DETERMINE THERMAL SERVICE FACTOR (Ft)

Refer to table 2, page 7

Ambient temperature = 68°F

Ambient temperature °F	-20	0	20	40	60	68
Factor Ft	1.64	1.50	1.36	1.22	1.07	1.0

$$F_t = 1.0$$

## 7 CHECK THERMAL CAPACITY OF GEARBOX SELECTED

### DETERMINE THERMAL INPUT POWER CAPACITY (Pt)

Refer to ratings tables

RATIO	OUTPUT SPEED	CAPACITY	SIZE OF UNIT								
			B0210	B0310	B0410	B0510	B0610	B0810	B0910	B1010	B1110
60	29	Input Power HP (mech)	0.29	0.38	0.50	0.64	0.98	1.24	1.70	2.05	2.52
		Input Power HP (therm)	0.42	0.55	0.81	0.92	1.31	1.79	2.13	2.70	2.88
		Output Torque lb-in (mech)	272	404	570	782	1305	1699	2427	2986	3739
		Efficiency	0.43	0.49	0.53	0.57	0.61	0.64	0.66	0.67	0.69

$$P_t = 1.31 \text{ HP}$$

## 8 DETERMINE ALLOWABLE OUTPUT POWER THERMAL RATING (P<sub>therm</sub>)

$$\begin{aligned} P_{\text{therm}} &= \frac{P_t \times F_t \times \text{efficiency}}{100} \\ &= \frac{1.31 \times 1.0 \times 58}{100} \\ &= 0.80 \text{ HP} \end{aligned}$$

Thermal output power capacity (P<sub>therm</sub>) must be equal or more than absorbed output power to drive machine

$$\text{Absorbed output power} = 0.375 \text{ HP} \quad P_{\text{therm}} = 0.80 \text{ HP}$$

Therefore unit is acceptable

## 9 CHECK OVERHUNG LOADS

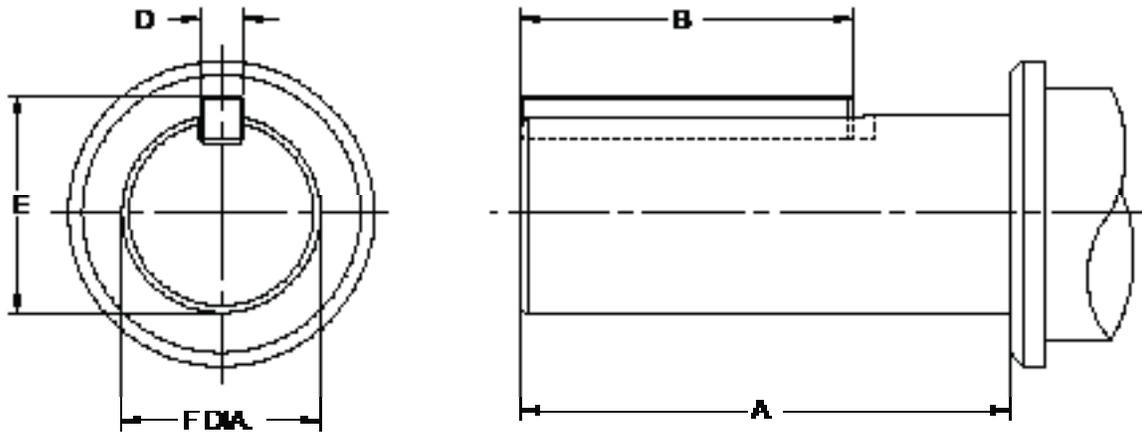

If sprocket, gear, etc is mounted on the input or output shaft then refer to Overhung loads procedure, page 64

NOTE: If any of the following conditions occur then consult our Application Engineers:

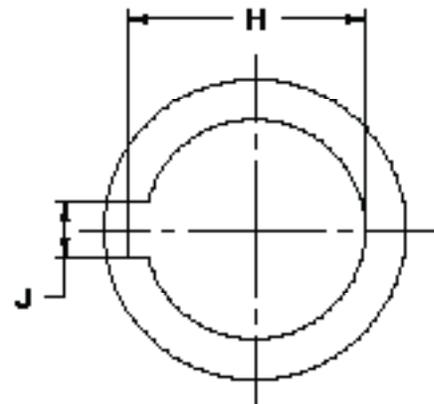

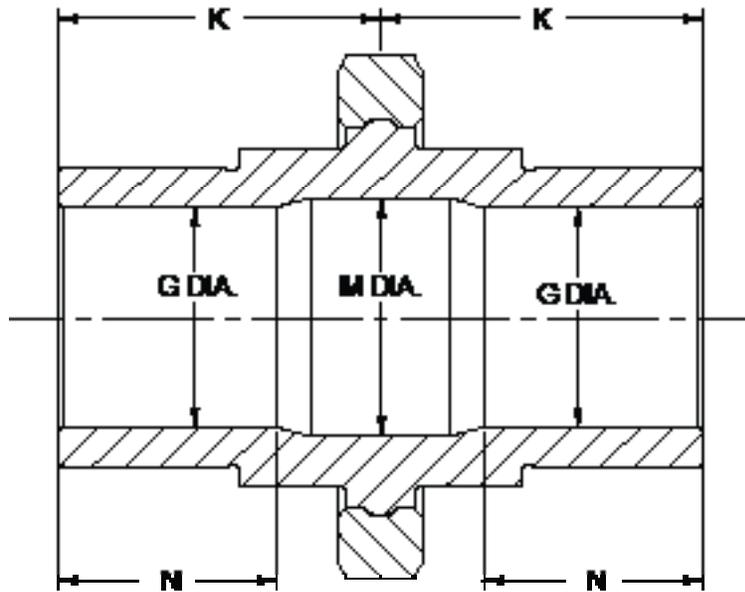

- a)  $\frac{\text{Inertia of the Driven Machine (Referred to motor speed)}}{\text{Inertia of Gear Unit plus Motor}} > 10$
- b) Ambient temperature is above 120°F
- or c) The unit is required without a fan

### SPECIAL UNIT FEATURES - WASHDOWN

Available for all single reduction motorized reducers, with or without bases.

#### Standard Features

- Vent - free eliminating contamination of reducer
- Smooth flat exterior is easily washable

#### Severe Duty Option - Column 15 Entry H, P

- USDA approved white epoxy paint

#### Washdown Duty Option - Column 15 Entry J, S,

- USDA approved white epoxy paint
- Exposed portions of hollow output shaft plated for protection
- Unused, tapped holes plugged to simplify washdown
- Stainless steel fasteners
- Stainless steel solid output shafts

#### Light Washdown Duty Option - Column 15 Entry K, R

- Exposed portions of hollow output shaft plated for protection
- Unused, tapped holes plugged
- Stainless steel fasteners
- Stainless steel output shafts

Cone Drive

# SERIES B

INSTALLATION MAINTENANCE  
& LUBRICATION

## 1. GENERAL INFORMATION

The following instructions will help you achieve a satisfactory installation of your Series B unit, ensuring the best possible conditions for a long and trouble free operation.

All units are tested and checked prior to shipment, a great deal of care is taken in packing and shipping arrangements to ensure that the unit arrives at the customer in the approved condition.

Optimum performance is best achieved by a process of gradual load increments, up to the full value, over the first 50 hours or so of their working life. During these early stages of running, sensible precautions should be taken to avoid overloads.

The gear unit operating temperature may be higher during this period of run-in. A progressive reduction in temperature may occur over many hours until the unit has reached its highest efficiency.

## 2. MOUNTING OF COMPONENTS TO EITHER THE UNIT INPUT OR OUTPUT SHAFT

Shaft dimensions and tolerances are on page 13.

- Items (such as gears, sprockets, couplings etc) should not be hammered onto these shafts since this would damage the shaft support bearings.
- The item should be pushed onto the shaft using hydraulic or hand press with the shaft supported at the opposite end.

## 3. WEATHER PROTECTION OF UNIT

All Series B units are provided with protection against normal weather conditions. Where units are to operate in extreme conditions, or where they are to stand for long periods without running, e.g. during plant construction, we should be notified when ordering so that arrangements for adequate protection can be made.

## 4. INSTALLATION

### 4.1 MOTORIZED AND REDUCERS

All sizes are factory filled with a high quality synthetic lubricant. They are 'Lubricated for Life' and require no routine maintenance in service.

### 4.2 MOUNTING TO CUSTOMER EQUIPMENT

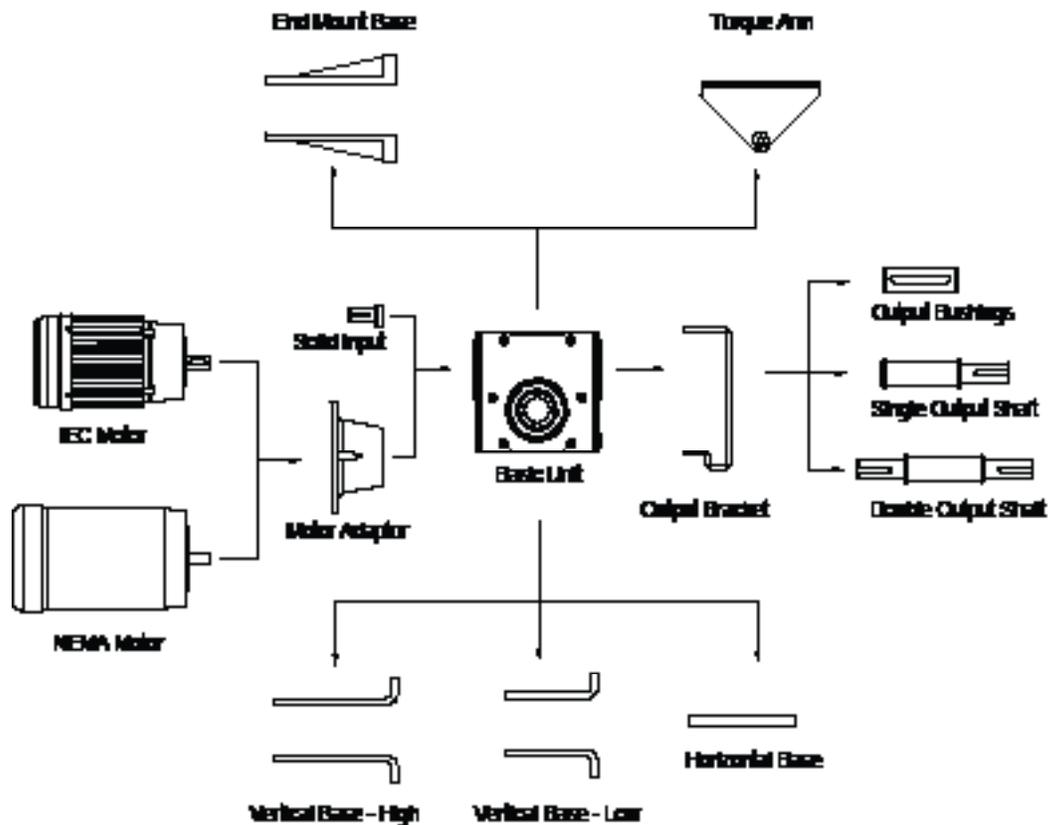

Mounting the gearhead flange facing or feet to the customer equipment use screws to ISO grade 8.8 minimum.

Torque tighten to:

Screw Size	Tightening Torque	Tightening Torque
M6	88 lb-ins	7.3 lb-ft
M8	220 lb-ins	18.3 lb-ft
M10	450 lb-ins	37.5 lb-ft
M12	750 lb-ins	62.5 lb-ft
M16	1770 lb-ins	147.5 lb-ft
M20	3100 lb-ins	258.3 lb-ft
M24	5400 lb-ins	450.0 lb-ft

### 4.3 MOTOR CONNECTIONS TO MAINS

Connection of the electric motor to the mains supply should be made by a qualified person. The current rating of the motor will be identified on the motor plate, and correct sizing of the cables to electrical regulations is essential.

#### BASE ASSEMBLY (TYPES B, H, L, J)

- 1 Clean shaft extension with petroleum spirit.
- 2 Remove paint from locating faces on gearcase with scraper and petroleum spirit.
- 3 Secure feet to gear case with nuts and bolts provided to thumb tightness, in required operating position.
- 4 Ensure foot pads are correctly seated.
- 5 Secure to foundations with bolts to thumb tightness and line up unit.
- 6 Tighten feet bolts to unit.
- 7 Check shaft alignment (see page 26) and tighten down bolts.

#### OUTPUT SHAFT ASSEMBLY

- 1 Clean output shaft and bore in gear unit with petroleum spirit.
- 2 Fit keys into output shaft, ensuring they are firmly seated.
- 3 Press shaft into gear unit bore to give desired shaft handling (Left or Right), until firmly up against shaft shoulder.
- 4 Fit circlip into groove in shaft on opposite side to extension.

Series B units are factory filled with a high quality synthetic lubricant. They are “Lubricated for Life” and require no routine maintenance in service.

In the event of a major overhaul involving strip-down and re-assembly of the gear unit refer to Table 1 for a list of approved lubricants. Lubricant quantities are given in Tables 2 & 3.

Table 1 Approved Lubricants

**Type H Polyalphaolefin based synthetic lubricants**

These lubricants are suitable for ambient temperatures of 32°F to 104°F (0°C to 40°C); outside of this, please contact our Application Engineers

SUPPLIER	LUBRICANT RANGE	GRADE 7H
		OIL SUPPLIERS' CORRESPONDING DESIGNATIONS
Chevron-Texaco	Clarity Synthetic PMO	460 (-23)
Exxon Mobil Corporation	SHC 600 Series	634 (-34)

**DANGER** Numbers in brackets indicate recommended minimum operating temperature in °F. The unit must not run below this temperature

Table 2 Lubricant Quantities (liters)

Applicable for all mounting positions:

CONVERSION TABLE

Liters to US gallons = liters x 0.26  
 Liters to Imperial gallons = liters x 0.22

MOTORIZED or REDUCER	Oil Capacity	UNIT SIZE								
		B02	B03	B04	B05	B06	B08	B09	B010	B011
	Quarts	0.14	0.26	0.34	0.45	0.58	0.96	1.48	2.00	1.70
	Liters	0.13	0.25	0.33	0.43	0.55	0.91	1.40	1.89	1.61

Table 3 Double Reduction Lubricant Quantities

Applicable for all mounting positions:

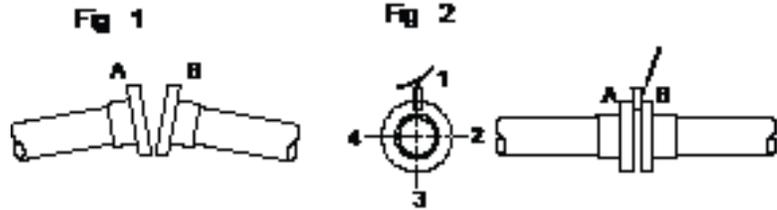

Unit Size	B0520		B0620		B0820		B0920		B1020		B1120	
	Primary	Secondary

Liters	0.13	0.57	0.13	0.76	0.33	1.18	0.33	1.70	0.43	2.46	0.43	2.09

## GENERAL INSTRUCTIONS

### SHAFT ALIGNMENT Coupling Connections

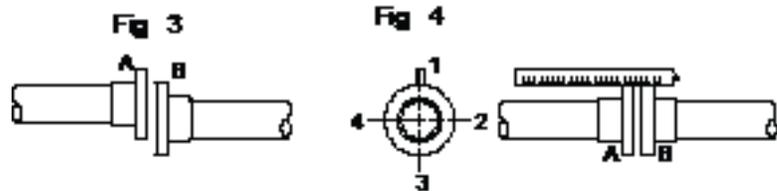

#### Angular Errors

- 1 Take up end float pushing in shaft ends.
- 2 Using thickness and feeler gauges, take readings in positions 1, 2, 3 and 4 (Fig 2).
- 3 Adjust unit by shimming under feet.

#### Eccentric Errors

- 1 Place straight edge across coupling halves at points 1, 2, 3 and 4 (Fig 4). If coupling diameters are not equal, use feeler gauge equal to half the difference in diameters.
- 2 If error is in vertical plane, adjust height of unit. If error is in horizontal plane, move unit transversely.

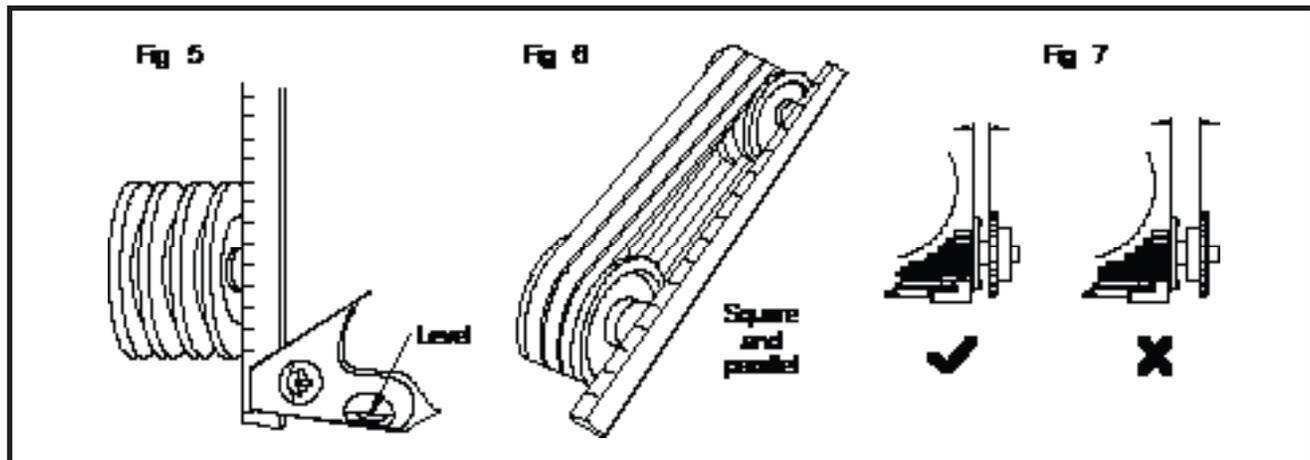

## CHAIN AND BELT DRIVES

Mount sprockets or pulleys as close to the gear unit as possible to avoid undue bearing loads and shaft deflection see Fig 5. Chains and belts should be sufficiently light as to prevent slip OVER TIGHTENING CAN CAUSE DAMAGE TO THE UNIT. Consult manufacturers' recommendations.

Check that driving and driven shafts are square and parallel using straight edge as in Fig 6.

Check horizontal shaft alignment using combined square and level as in Fig 7.

## FIT GUARDS IN ACCORDANCE WITH REGULATIONS

If a unit is to be subject to long term storage contact our Application Engineers.

### WARNING

The customer shall be responsible for the proper use of articles supplied by us, particularly the rotating shafts between their driving and driven members, and their guarding for safety. We shall not be responsible for any injury or damage sustained as a result of the improper use of the articles supplied.

Attention is hereby drawn to the danger of using naked lights in proximity of opening in gearboxes and gear units supplied by us, and the company shall not be liable for any claim for injury or damage arising from any action in contradiction of this warning.

## GENERAL SAFETY

Potential hazards which can be encountered during installation, maintenance and operation of drives is covered in greater detail in the product safety page at the back of this booklet.

Advice is also given on sensible precautions which need to be taken to avoid injury or damage. **PLEASE READ !**

REDUCER

## Overhung Loads (Lbs) On Shafts

### Maximum permissible overhung loads

When a sprocket, gear etc. is mounted on the shaft a calculation, as below, must be made to determine the overhung load on the shaft, and the results compared to the maximum permissible overhung loads tabulated. Overhung loads can be reduced by increasing the diameter of the sprocket, gear, etc. If the maximum permissible overhung load is exceeded, the sprocket, gear, etc. should be mounted on a separate shaft, flexibly coupled and supported in its own bearings, or the gear unit shaft should be extended to run in an outboard bearing. Alternatively, a larger gear is often a less expensive solution.

Permissible overhung loads vary according to the direction of rotation. The values tabulated are for the most unfavorable direction with the unit transmitting full rated power and the load P applied midway along the output shaft key. Hence they can sometimes be increased for a more favourable direction of rotation, or if the power transmitted is less than the rated capacity of the gear unit, or if the load is applied nearer to the gear unit case. Refer to our Application Engineers for further details. In any event, the sprocket, gear etc. should be positioned as close as possible to the gear unit case in order to reduce bearing loads and shaft stresses, and to prolong life. All units will accept 100% momentary overload on stated capacities.

### Overhung load (lbs)

$$P = \frac{HP \times 126,000 \times K}{N \times D}$$

- P = equivalent overhung load (lb)  
 HP = power transmitted by the shaft (HP)  
 N = speed of shaft (RPM)  
 D = pitch diameter of sprocket, etc. (in)  
 K = factor

Note: 1 lb = 4.448 N = 0.454 kg

### Overhung member

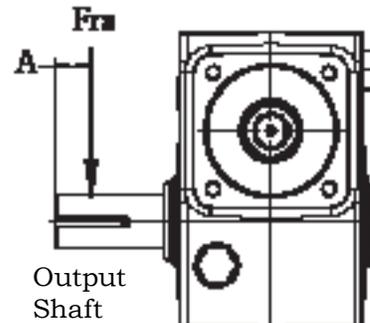

### K (factor)

Chain sprocket*	1.00
Spur or helical pinion	1.25
Vee belt sheave	1.50
Flat belt pulley	2.00

\* If multistrand chain drives are equally loaded and the outer strand is further than dimension A output, contact our Application Engineers.

**IMPORTANT****Product Safety Information**

**General** - The following information is important in ensuring safety. It **must** be brought to the attention of personnel involved in the selection of power transmission equipment, those responsible for the design of the machinery in which it is to be incorporated and those involved in its installation, use and maintenance.

Our power transmission equipment will operate safely provided it is selected, installed, used and maintained properly. As with any power transmission equipment **proper precautions must** be taken as indicated in the following paragraphs, to ensure safety.

**Potential Hazards** - these are **not** necessarily listed in any order of severity as the degree of danger varies in individual circumstances. It is important therefore that the list is studied in its entirety:-

- 1) Fire/Explosion
  - (a) Oil mists and vapour are generated within gear units. It is therefore dangerous to use naked lights in the proximity of gearbox openings, due to the risk of fire or explosion.
  - (b) In the event of fire or serious overheating (over (over 570 °F (300 °C)), certain materials (rubber, plastics, etc.) may decompose and produce fumes. Care should be taken to avoid exposure to the fumes, and the remains of burned or overheated plastic/rubber materials should be handled with rubber gloves.
- 2) Guards - Rotating shafts and couplings must be guarded to eliminate the possibility of physical contact or entanglement of clothing. It should be of rigid construction and firmly secured.
- 3) Noise - High speed gearboxes and gearbox driven machinery may produce noise levels which are damaging to the hearing with prolonged exposure. Ear defenders should be provided for personnel in these circumstances. Reference should be made to state and federal regulations for reducing exposure of employed persons to noise.
- 4) Lifting - Where provided (on larger units) only the lifting points or eyebolts must be used for lifting operations (see maintenance manual or general arrangement drawing for lifting point positions). Failure to use the lifting points provided may result in personal injury and/or damage to the product or surrounding equipment. Keep clear of raised equipment.
- 5) Lubricants and Lubrication
  - (a) Prolonged contact with lubricants can be detrimental to the skin. The manufacturer's instruction must be followed when handling lubricants.
  - (b) The lubrication status of the equipment must be checked before commissioning. Read and carry out all instructions on the lubricant plate and in the installation and maintenance literature. Heed all warning tags. Failure to do so could result in mechanical damage and in extreme cases risk of injury to personnel.
- 6) Electrical Equipment - Observe hazard warnings on electrical equipment and isolate power before working on the gearbox or associated equipment, in order to prevent the machinery being started.
- 7) Installation, Maintenance and Storage
  - (a) In the event that equipment is to be held in storage, for a period exceeding 6 months, prior to installation or commissioning, we must be consulted regarding special preservation requirements. Unless otherwise agreed, equipment must be stored in a building protected from extremes of temperature and humidity to prevent deterioration.  
The rotating components (gears and shafts) must be turned a few revolutions once a month (to prevent bearings brinelling).
  - (b) External gearbox components may be supplied with preservative materials applied, in the form of a "waxed" tape overwrap or wax film preservative. Gloves should be worn when removing these materials. The former can be removed manually, the latter using white spirit as a solvent.  
Preservatives applied to the internal parts of the gear units do not require removal prior to operation.
  - (c) Installation must be performed in accordance with the manufacturer's instructions and be undertaken by suitably qualified personnel.
  - (d) Before working on a gearbox or associated equipment, ensure that the load has been removed from the system to eliminate the possibility of any movement of the machinery and isolate power supply. Where necessary, provide mechanical means to ensure the machinery cannot move or rotate. Ensure removal of such devices after work is complete.
  - (e) Ensure the proper maintenance of gearboxes in operation. Use only the correct tools and our approved spare parts for repair and maintenance. Consult the Maintenance Manual before dismantling or performing maintenance work.
- 8) Hot Surfaces and Lubricants
  - (a) During operation, gear units may become sufficiently hot to cause skin burns. Care must be taken to avoid accidental contact.
  - (b) After extended running the lubricant in gear units and lubrication systems may reach temperatures sufficient to cause burns. Allow equipment to cool before servicing or performing adjustments.
- 9) Selection and Design
  - (a) Where gear units provide a backstop facility, ensure that back-up systems are provided if failure of the backstop device would endanger personnel or result in damage.
  - (b) The driving and driven equipment must be correctly selected to ensure that the complete machinery installation will perform satisfactorily, avoiding system critical speeds, system torsional vibration, etc.
  - (c) The equipment must not be operated in an environment or at speeds, powers, torques or with external loads beyond those for which it was designed.
  - (d) As improvements in design are being made continually the contents of this catalog are not to be regarded as binding in detail, and drawings and capacities are subject to alterations without notice.

The above guidance is based on the current state of knowledge and our best assessment of the potential hazards in the operation of the gear units.

Any further information or clarification required may be obtained by contacting our Application Engineers.
